Act 1 – The Business, Findings & Competition

Executive Summary

We use the word epidemic to describe the issues with children's obesity. We use the word lazy to describe a child that loafs on the couch. We use the words Attention Deficit Disorder if children are easily distracted.

We need to use the word **accomplished** to describe our children! We need to create interactive outdoor stories and games that are exciting, full of educational information and allow our children to hold a portable encyclopedia of fun and learning. We also need to build storylines and content that will adapt to the children's learning preferences and excite them to be active.

GenZPlay is creating children's interactive outdoor apps and technology. The key words being outdoor and interactive. The technology and educational industry is experiencing an explosion of children's apps and devices focused on helping with sedentary lifestyle's and an epidemic of childhood obesity. They are developing technologies that are focused on tracking the children's movement throughout the day to monitor fitness levels and finding new ways of educating our children. The parents are extremely overwhelmed with the mind-boggling amount of incredible games, children's eBooks, educational and story apps that are being released every day.

The problem with the current fitness apps and devices is that these children are not being captivated by their minds as well. We want to show the children nature, exploration, mystery and fitness with an electronic device on their wrist, hip or in their backpack. The electronic device should become second nature to all of us, just an extension of our desire for education and information, and not a device that captivates us in to little zombies.

GenZPlay is currently seeking funding to enhance the current app on the market, Big Cat Race, which is available for Android and iOS devices. We also require funding for research and development of additional applications and hardware, including Bluetooth hardware for Virtual 'Augmented Reality' Frisbee Golf, electronic games for the Custom Integration market, and GenZPlay branded Bluetooth monaural headsets. Specifically, the goal of the plan is to develop a sustainable business model and transition from a donor-funded phase to a self-financing, sustainable phase over a two-year period.

Industry Findings

Michelle Obama opened the door to technology solutions for today's children's health issues with the Let's Move campaign, which in 2010 judged from over 100 submitted apps to choose the best for health and lifestyle changes among our children. Nike has created the 'Designed to Move' organization to reach children under the age of 10, the years that are vital to a child's fitness and physical development. Exergaming.com has created a new ideology of wellness for children, by opening its newest facility at the Chicago Bulls/White Sox Training Academy. Exergaming is focused on combining gaming and exercise. Xavix, Hopsports, iBitz, Nerf Cyberhoop, and especially Zamzee are also highly focused on the future of exergaming as well.

> *"First lady Michelle Obama on Thursday announced an effort to engage 50,000 schools in an effort to bring physical activity back to the classroom, and she's getting a big assist from Nike. The shoe-maker will spend $50 million on the "Let's Move Active Schools" effort over the next five years. Several other organizations are combining to donate $20 million, including the GENYOUth Foundation, ChildObesity180, Kaiser Permanente and the General Mills Foundation." -The Washington Post.*

The world is currently facing the issue of obesity and inactive lifestyles amongst our children. Previous generations grew up in houses that were not filled with distracting electronic devices. Our imaginations were creating fantasylands in the sand boxes and jungle gyms in the backyard of our low-tech homes. GenZPlay is building educational computer applications, to be enjoyed outdoors among the animals, trees, rocks and structures of our world. These methods will bring the virtual world out of the home, which is where children have found their stimulation as of today.

Research shows us that students who play cooperatively are more highly motivated to play the exergames than students who played competitively. Students who were highly motivated to play the exergames, such as having a desire for control and choice and a desire to achieve personal goals, expended more energy during game play than other students did, on average. The research found:

- Active Gaming is a proven and exciting way to offer children an engaging way to stay active during the school day.
- Enhancement in the areas of academic performance, fitness, behavior, school attendance, sports performance accompany exergaming.
- Sports specific training programs using active gaming products as a tool to add to existing training methods.
- Heart rate and data tracking tools are perfect for child assessment and reporting tools in your community.
- Active Gaming products are for all ages and abilities including beginners, athletes and special needs.
- Parents and Administrators will love seeing the positive health benefits of Active Gaming to share with the community.

Existing RPG's (role playing games) lure gamers into hours of play via a storyline game that involves interaction, but not on a physical level. Humans spend 3 billion hours per week gaming globally – Jane McGonigal, 'Reality is Broken'. Players are drawn to the games by the feeling of accomplishment of finishing a level, and getting to see the story/video played out.

The characters in a MMORPG (massive multiplayer online role playing game) are critical to the story being told. The watchers/players build a level of empathy for their character and other characters as the story unfolds, and it gives them a feeling of belonging or being a part of something. By combining exergaming and multiplayer gaming, we can create a new genre of app that capitalizes on interactive story telling and the lack of exercise based gaming.

Steve Calhoun, the founder of GenZPlay, introduced these outdoor fitness app ideas over 2 days at the 2011 Gravenstein Apple Fair in Sebastopol, CA. He put up 3 storyboards showing new interactive play structures and playhouses. He handed out 200 yo-yo's with the GenZPlay website on them and told the parents that GenZPlay was developing children's fitness apps for Apple and Android devices. The feedback was incredible and exciting. Every parent very much wanted something like this for his or her children. One couple said there children were not allowed to use technology.

If we combine technology with kinesiology programs and other health related issues, such as children's diabetes, we can teach, entertain and coach our kids to be the person they want to be. Research shows that moving more, proper sleeping habits and eating healthier can help prevent most of these lifestyle issues, yet lasting behavior change is often difficult to achieve unless we allow the child to motivate themselves. Getting fit doesn't require a gym or a routine. An app is an inexpensive way to have a motivator built into the devices we use on a daily basis.

> "Health-related applications for smartphones and tablets are a booming business, but in Africa and Asia "mobile health" could actually be a lifesaver for millions, industry leaders and aid, organizations say. Mobile phones could save up to a million lives over the next five years in sub-Saharan Africa, according to a report by mobile industry association GSMA and global consultants PwC released at the February 25-28 Mobile World Congress in Barcelona. -The Indian Express

Sales Benchmarks for other App publishers (Previous 24 months)

App Name or Developer	Premier App	Total App Sales
Chore Monster – Ages 5 up	50,000	50,000
Curious Hat Apps – Ages 3-15	20,000	60,000

Zombies Run – Ages 9 up	180,000	223,000
Fitbit – Ages 5 up	240,000	300,000
PBS Kids – Ages 2-12	420,000	1,600,000
Parenting Reminder – Ages 16 up	1,000,000	1,200,000
Runtastic – Ages 12 up	1,000,000	3,000,000
Subway Surfers – Ages 5 - 16	4,000,000	12,000,000
Angry Birds – Ages 5 up	180,000,000	500,000,000

Problem & Opportunity

> "Mobile devices like Smart Phones, iPod Touches, and tablets are becoming important parts of the entertainment and learning lives of kids and families. Parents see them as "neutral" devices – neither isolating family members from one another, nor bringing them together – they are just a part of everyday life. Kids and parents use them both individually and together to play, read, learn, and relax; but they are eager to find more engaging ways to play together and learn." - playsciencelab.com

Parents, particularly Mom's, need a technology guide. Running a household can be made easier with Mommy/Daddy/Child chore apps, combined with a curriculum of children's apps that will help with inactivity and education. Parents do not have time to research technology and search through the 1000's of apps available. The massive amount of apps has caused purchasing confusion and has led to a new business model of app blogging, which is mostly filled by 4 million 'Mommy Bloggers'.

Three of the biggest blogging platforms are Parenting, Health and Gaming and its mainly focused on what technology and software can do for us, as we have lost faith in education and our government (specifically the medicine/insurance portion of government). We even question ourselves as parents and look to the Internet for advice. The children who have had the most education on the Internet and with computers are Generation Y, which are currently in, or have recently come out of college. These kids are now becoming parents and not only can see the benefits of apps, but are well aware of what technology is capable of.

The app market is the most prolific and fastest paced technological advancement created ever, and with the current acceleration of body sensor devices and eHealth products, we are seeing the next dot.com boom. Pricing is stable on the technology

market for the first time in the past 50 years, and practically every child can get its hands on a smart device.

Children live with video games and Internet access today, and one of the largest market shares in app purchasing is children's educational apps and eBooks. Of the apps designated for 'kids', the most sold segment is ages 3-6, with the next highest segment being 6-12. – 2012 FTC report. Parents are using the smart devices to teach their children earlier and children crave these apps as they enjoy learning, the interactivity and the feelings of accomplishment that comes with gaming.

Doctors, health teachers and psychotherapists are realizing the healing impact that the new apps are bringing to the world. The investments currently being made in eHealth products is staggering. Pediatricians are under educated in the benefit of apps, and have minimal time to do the research on which health apps work the best. The research is thin and its very easy for a doctor to push the idea of educational and health apps off to the responsibility of parents and teachers.

GenZPlay is creating apps that are clearly educational with nutritional and health interests in mind. We are building the foundation of what all children's apps should be. We are creating a core set of components; the Educational core, the Nutrition core, and the Fitness Core, and a password protected rewards system administered by parents or older siblings. We will create a business model to partner with other app developers to create a common grouping of apps that are represented under one 'Logo' or common genre.

We are creating apps that entertain like a video game, require some sort of exercise to use (like Wii Fit), but using reactance theory, which motivates the child to want to use the apps of their own accord. As Wikipedia defines it, 'Reactance is a motivational reaction to offers, persons, rules or regulations that threaten or eliminate specific behavioral freedoms.' Reactance occurs when a child feels that someone or something is taking away his or her choices or limiting the range of alternatives. Their needs to be apps that excite the children, and bring exercise, nutrition, and fun, all together, starting at an early age.

The Baby-Boomer parents, who didn't quite understand how the world changed so fast with the introduction of TV's and computers, instigated the recent apprehension of technology use with our children. As any good parent does, they protect their children from issues or presences unknown. We now know that technology is just a more entertaining looking glass into a world of education and understanding, so we need to take back time and give children quality access to technology.

In other words, there is a large market for quality activity orientated apps, and generations who are craving to build them and to use them. As the educational system is now transforming from babbling and confused teachers to entertainment creators, their goal is always the same, and currently is not how to improve communication with their students but how to entertain their students with what

they want to learn. Children love apps, and parents love apps. Give them apps that are enriching and give them exciting games that are played outdoors.

Children want to be entertained and they love the feeling of accomplishment that comes with overcoming a challenge. Where are they getting most of these challenges accomplished?.... in the virtual world. We need to make these challenges available in the real world and with educational tools built into them. Will a 'Middle School' degree be available, from the use of Massive Multiplayer Educational apps, before you graduate on to an actual High School? Many menial courses/classes can be bypassed or completed via an app model.

GenZPlay is taking existing technologies and making them better and more exciting. There are many apps that are devoted to children doing chores, personal hygiene and movement. We can take all of the apps that are currently out there, pull the best parts from them, and create new and exciting apps that contain the core principals of GenZPlay app development.

Our founder, Steve, has extensive wisdom and experience when it comes to User Interfaces. He can take any product, find the weaknesses, and make it better. He also has un-paralleled understanding of what kids enjoy playing and what type of interface is required to engage the children.

> *"We play video games as the virtual world is more rewarding and satisfying."*
> *–Jane McGonigal.*

Jane is an American game designer and author who advocate's the use of mobile and digital technology to channel positive attitudes and collaboration, in a real world context. She believes that gaming should be used as a means for improving the quality of human life or working towards the solution of social ills.

Advantage

The world is in a state of change. New technology is being released at such an accelerated pace that many parents are wary about how to proceed with usage of electronics for their children. 4 million mommy bloggers are sharing ideas on how to raise and educate their children. GenZPlay creates interactive outdoor applications that engage and challenge children, by way of educating them and giving them a feeling of accomplishment.

We have assembled an incredible team of tech savvy individuals with many years of wisdom. We have brought celebrities and Olympians to the team as an essential part of marketing our technologies. We have found many mothers, with huge blog followings, that are excited to be able to help promote GenZPlay. We have connected with other app developers to work on sharing some of the more simplistic portions

of the technology we are producing. These app developers can integrate their existing programming into our apps and their considerable following of existing users can become our following.

GenZPlay has built and released a demo version of our first app for iOS and Android platforms. We have tested the technology with the children, and we have received exciting feedback, and many great ideas on how to improve it. We have 10,000 downloads of the app currently, and are expecting 300,000 downloads within the next 12 months.

At this unique point in history, we have the chance to help with some serious childhood epidemics; including nutrition, obesity, diabetes, motivation and education. We can change the direction of all of these issues, quickly and easily by using the same techniques, that already capture the TV watching and video gaming children of today. The concepts are here, the technology just needs to be re-routed in a different direction. This window of opportunity is just opening and we have about a year to perfect and market our products before the industry pinnacle.

Creating this technology is easy, as the hardware and software systems are already in place or are within 12 months of fruition. We can swiftly move the video gaming experience outdoors, into the gym, or at least create more movement inside of the home.

"If a children can't learn the way we teach, maybe we should teach the way they learn." - Ignacio Estrada

Competition

There are many forms of competition for GenZPlay, but no forms that are the same as the type of model that we are pursing. There are pedometers (motion trackers), fitness apps, apps about nature (fauna, flora and animals), and educational apps. There are also 3 types of children's fitness technology models today. Those that rely on the accelerometer in the device or a 3rd party separate pedometer, those that rely on the GPS (for geo-caching type games), and those that are purely informational.

Very few of these apps are designed to take gaming outdoors. An example of a possible competitor is an app called 'Zombies, Run', except their app is designed for adults. It is a hit in the sense that it's the first type of this app where the runners/joggers use an ear-bud to hear a storyline where zombies are pursuing them, so it is true Exergaming. They have over 220,000 downloads at $4.99 each.

There are a few interactive apps involving nature. You can take a picture of a leaf, and the smartphone will tell you what type of tree/plant it is and then give you a full description. You can capture the song of a bird, and an app will tell you what type of

bird it is. This is the beauty of our world outside of the house, but all gaming is currently focused on fantasy worlds explored from the couch. The outdoor world is the best world there is to explore, so lets create 'apps for that'.

Zamzee has a product that tracks how many steps you took during the day, by a device attached to the belt or shoe. The child can then log onto the computer at home, and see their performance in varying entertaining and satisfying ways, and they can also earn tangible rewards by their amount of activity. The system calculates how much exercise they had and then the child gets rewards, on the companies website or Amazon's website. It's a great idea, but it's "bribing" the children into doing it, but they are doing it. Their research has shown that they are getting 40% more fitness per day.

Currently, there are manufacturers that are creating the future wave of playground equipment and some that include electronic devices incorporated into the playground. The ordinary slide, monkey bars and merry-go-round are still a part of the play area, but there are so many new and creative ideas. These new exercise structures are built to stimulate children's brains as well as exercise their bodies. Incorporating our apps, with companies like these, will create new levels of fun.

"Self motivated, self-rewarding activity really does make us happier. More importantly, its evidence that gamers aren't escaping their real lives by playing games. They're actively making their real lives more rewarding." – Jane McGonigal

Business Model

The technology business is the same as any other business. It will always remain the same. Find a solution that the consumer needs, and that electronics will fulfill, and build it. The only difference is, in the past, you had to create something absolutely unique due to patents and copyright infringements. The app market is nothing like this.

Using the best ideas from other products is the greatest advantage we have. There are 1000's of apps on the market but most of them are not entertaining or are sloppy. They are built by individuals in hopes of getting rich quick, or on the flipside, creating a viable financial model, or they are individuals testing to see how popular there idea would become by creating apps as a hobby or for a class.

By using the components of other kids apps that have shown the most enticement and popularity, we can use all or portions of those designs to make the GenZPlay apps even better. We currently have designs for 3 apps that are unique to us. The issue is; will the children or the parents want to play with them. Well, if they are already buying other apps that are similar to the core components of our apps, they will buy an app that has those components all built into one. Package deals/sales has always won the hearts of consumers.

This is an app business, and we develop the integration with 3rd party hardware solutions, but the apps are the centerpiece to taking the gaming outdoors and making it more fun.

Custom Integration

Steve Calhoun's 1st company, Technical Visionaries, is a custom integration company. The custom integrator (CI) market brings us a higher level of play technology installations. Technical Visionaries will carry on with current and future CI customers until such time that GenZPlay is profitable. We will then sell our high-end customer base to another company or roll it off into its own entity to continue installing GenZPlay systems.

CI's are use to installing technology and electronics that require a higher level of installation experience. We intend to create product that is focused on the high-end market, where the parents can afford such luxury, and use this playing field as a testing ground for evolving some of our initial high-tech products into a lower priced, expanded format.

The CI industry has been based upon the 100% markup rule for many years. However, due to the extensive purchasing of products by the customers themselves, the margins have reduced drastically on product sales. In return, CI's have to find other profitable products, cut operating costs and raise hourly installation rates to fill this gap. We intend to market our products to this high-end clientele, but since GenZPlay products will not be sold in stores initially, Technical Visionaries and other CI's can install and price the systems accordingly.

CI's are constantly looking for the next market to take advantage of, but it's just a cycle of standard products that constantly evolve. The standard product offerings are: Wiring, Audio, Video, Control, Networks, Security, Video Security, Lighting and Climate control. As one niche starts to lose its progression, the CI's have to completely switch gears with their business models and rededicate resources and training to the new products. Currently, the trend is for security and video systems, and the next trend will most likely be the new 4K televisions, so GenZPlay will be providing another new segment of business for CI's.

Initial Concepts/Products for CI's:

-Electronic Tag & Chase
Attach a single or multiple LED's to a BT tracker and mount them to trees, rocks, etc around the yard. The app will create a random courses and time them as they complete it. Children can also tap on the LED/BT tracker and then the next one would light up to extend the course, or follow the lights like a game of interactive TAG.

-Scavenger Hunt
Allow the parents to mount a BT tracker to a prize and place it somewhere on their property. The app will setup an adventure and use clues to guide them towards its location.

Features:
-LED's can double as landscape accent lighting
-Yard mapping. Increases installation hours for CI's
-Solar charging station for electronics
-Speakers in the yard for music and gameplay
-Integrated playhouses with electronic white boards
-Integrated play structures / jungle gyms

Goals for 1st six months:

1. Funding
2. Legal documents
3. Contracted programmers start to update on current Big Cat Race, (BCR) app
4. Find office space
5. TechViz Installation Manager comes on board
6. Contact existing Technical Visionaries (TechViz) customers with news release
7. Finalize organization of custom integration business, TechViz
8. Hire Graphic Artist / Website designer
9. Hire 3rd party social marketing team, such as Google Wildfire, to market GenZPlay and TechViz
10. Improve website's
11. Work on graphics for updated BCR app
12. Press releases and marketing push for updated app release.
13. Release BCR app update
14. Raise BCR app price to $1.99
15. R&D on Frisbee Bluetooth device & LED Bluetooth tracking device
16. Hire office manager/assistant/accountant

GenZPlay Team

Sheung Li (CEO)

Sheung has more than 15 years of experience in building the market for innovative technologies. He was previously the Director of Product Development and Marketing of SiBEAM, where he debuted Gigabit Wireless and Full HD Wireless Display chipsets in the consumer electronics and personal computing markets.

Prior to this, he was responsible for product management at Atheros Communications (NASDAQ: ATHR), launching the six generations of Wi-Fi semiconductors that led to the company's first $250mm of revenue and IPO.

Sheung has also held a management position at 3Com Corporation, is the Vice Chair of the IEEE 802.11n task group and a Rapporteur of the European Telecommunications Standards Institute; he holds patents in low power and adaptive radio technologies.

Sheung received a B.S. in Computer Science and Engineering from the Massachusetts Institute of Technology and both a M.S. in Manufacturing Systems Engineering and an MBA from Stanford University. Sheung is also an incredible snowboarder.

Stephen Calhoun (Founder and CTO)

Steve is the creator of GenZplay. His lifelong passion for sports, games, and now, raising his son, Alex, has spurred a vision of outdoor electronic gaming and playhouses. Steve was first introduced to the Apple II computer in 1979 when his father was programming for LL Bean in Freeport, Maine. Steve has been working with Apple, PC and Unix system computers ever since.

He started working with Home Automation and Home Theater systems in 1999, and his extensive knowledge of electronics has lead to the creation of the high tech outdoor games and equipment that makes up the backbone of GenZPlay unique designs. Steve has a degree in Architecture and is a Microsoft Certified Systems Engineer. He's also an extreme sports fanatic.

As Steve Jobs said 'Creativity is connecting things. A broad set of life experiences can often see things that others miss. Don't live in a bubble. Connect ideas from different fields'. He also taught us that if customers can reach their dreams, you could win them over.

Steve Calhoun's background has been diversified over the past 25 years, and it has given him experience on the common business practices and functions of these various careers. He's had 64 different jobs. He's done everything from a Bakery Accountant in Maine to a 150' Yacht Captain in Florida. He's been a Ski Shop Manager in Colorado and has created amazing Audio/Video experiences for people to enjoy in their own homes and on Mega-yachts.

Steve has been educated in most forms of Engineering: Structural, Mechanical, Architectural, Electrical, HVAC, and Landscape, which give him an incredible insight in how practically everything is manufactured and functions. His understanding of these many careers, his sporting accomplishments, and his extensive education in computers and technology is giving him the ideas to connect multiple technologies, healthy necessities and human passion's together.

Daron Rahlves – Fitness Consultant and Celebrity Endorsement

The most decorated American Downhill and Super G skier in history. Daron won 12 World Cup races, had 28 World Cup podiums, 7 US National Titles, is the 2001 World Champion in Super G, Silver medal at the 2005 Worlds in DH and Bronze medal in GS. He was the winner of the legendary Hahnenkamm Downhill in 2003 and SG in 2004 along with 7 podium finishes in Kitzbuhel over 5 years.

Now ski cross is the competition of his choice. In 2008 Daron took the win in Skier X at Winter X Games 12. Daron has created the Rahlves' Banzai Tour. One of the most challenging ski races in the world. 4 stops at 4 of Lake Tahoe's premier resorts for incredible ski and snowboard action on off-piste natural terrain.Daron has 2 children that are enjoying the Big Cat Race.

Dr. John Emery – Health Consultant and celebrity endorsement

As successful as his San Francisco medical practice became, John Emery has never been defined simply by his surgery. He is a vitally active man with an enormous list of physical achievements, starting with a 1964 Olympic gold medal as a member of the Canadian four-man bobsled team. His brother Victor, who shared in the victory, spearheaded formation of the team after landing a chance ride on the Spanish bobsled team in the 1956 Winter Olympics with legendary auto racing driver Alfonso de Portago. The Emery brothers are now enshrined in Canadian Olympic annals, but John has never stopped facing physical challenges.

He is a pilot, and has competed in the Tevis Cup, a 100-mile-in-one-day horse race over the Sierra. He's run the Boston Marathon, swum both the Escape from Alcatraz and across San Francisco Bay. He's done the Hawaii Ironman, done marathons on skis, ridden a double century bike ride ("I forgot to take water with me, I got a little dehydrated"), and has run the Dipsea and the Double Dipsea, from Mill Valley to Stinson Beach and back over the spine of Mt. Tamalpais.

Dr. Adam Karns, MD – Health Consultant

Adam is a practicing internal medicine doctor in Beverly Hills since 1994. He brings the health perspective to the group and the desire to create an app that not only promotes health but can help with children's medical issues, such as diabetes. He has a medical degree from the University of Health Sciences, Chicago Medical School.

Jason Burrill – Creative Director

Jason is a national ranked snowboarder with many awards. He has a degree in Biology and a huge passion for nature, the outdoors and coaching children in Nordic and alpine skiing. He has raced mountain bikes, and he has raced motorcycles on the motocross circuit. His extensive skill in sports and deep understanding of what is required to win at these sports gives him a meaningful insight into the association between the body and the mind.

He has already, and will provide a powerful creative drive to the creation of these outdoor applications. Jason started a residential and commercial painting company 15 years ago to subsidize his sports training. During the summer, he is busy running a crew of painters and in the winter, he will rack up over 100 days of snowboarding and skiing. Jason is a USASA National snowboarder-cross champion and a giant slalom champion.

“A child sees everything, looks straight at it, examines it, without any preconceived idea; most people, after they are about eleven or twelve, quite lose this power, they see everything through a few preconceived ideas which hang like a veil between them and the outer world.” --Olive Schreiner

Act 3 – Customers, Marketing & Money

Customers

GenZPlay wants to create interactive games that are fun for parents as well. As parents, we try to give our children the best head start in life as possible. Why not learn about nature, exercise and the world outside as we help our children to respect nature's beauty, and the challenges and enjoyment that entertaining physical exercise can bring. Therefore, we intend to focus on the key to this future, which is a healthy lifestyle and Fun (Fitness uniting Nutrition)

Overall, Smartphones reign in the land of kids and digital mobile devices. Kids access them more than any other digital device, and use is consistent across household income levels. Not far behind are iPod Touches; and following at a distance are tablets and eReaders, both of which are more prevalent in higher income households. Older kids have more access to tablets, iPod Touches, and eReaders, while the youngest set gets on their parents' Smart Phones more than the other age groups. When it comes to having their own, kids are much more likely to have an iPod Touch.

The best possible way to portray our customers is to give examples of the various groups of individuals who are looking for these types of technology. The rest of this section is research that has been completed by others;

> *>> "I no longer believe that we have to choose between ceding the high-tech ground to our digital-native children or feigning and straining to control all aspects of it. There can be a third way. And while it's true that technology often puts up thick walls between parents and their kids, if used the right way, it can also be surprisingly good at helping to break them down." – Neil Swidey*

> *>> "But that was before. Today, with technology seeping into every aspect of our lives, grandparents have started to grow obsolete, according to a bleak new survey. Indeed, almost two-thirds of grandparents feel that their role is being usurped by Google, Wikipedia and YouTube -- the almighty advice gurus kids now turn to for traditionally grandparent-y advice on everything from history to recipes." – Huffington Post*

> *>> In the US, research shows that children aged seven to 18 spend, on average, a little more than seven hours a day in front of a screen. There are no definitive statistics on how much time children in other countries spend in front of a TV, computer or smartphone screen, but analysts say rates are likely to be similarly high. It makes sense, Dr Michelfelder says, to use some of that screen time to get*

them engaged in their health, like using a pedometer app. He warns patients not to download apps that are specific for doctors only, and notes that most of the current consumer medical apps are effective only when used in conjunction with a health professional.

In the US, mobile health app developers, not surprisingly believe the mobile health field is poised for explosive growth. By way of evidence for that, they cite surveys showing that:

- *Healthcare apps are the third fastest-growing app category for iPhone and Android devices*
- *Eighty percent of US doctors use smartphones and medical apps*
- *Doctors are 250% more likely to own a tablet than other consumers*
- *Forty percent of doctors believe mobile health technologies can reduce the number of office visits. -Business Day*

>> Physical activity programs for overweight and obese teenagers often fail due to low motivation and interest, and other personal, social, and environmental factors that make it difficult to exercise regularly. This study examined effects of exergames on low-income overweight and obese inner-city high school students. Exergames are video games that require physical exertion in order to play, and they offer game challenges and opportunities for social interaction that can make them compelling and fun.

This study recruited overweight and obese students from an urban public high school to play Wii Active exergames at school during lunchtime and after school. They were randomly assigned either to play competitively against other students or cooperatively with a partner to earn points together as a team. After six months, researchers assessed individual participants' intrinsic motivation by using validated survey instruments administered in interviews and measured energy expenditure with a hip-mounted actical accelerometer.

Key Findings:

- *Students who played cooperatively were more highly intrinsically motivated to play the exergames than students who played competitively.*
- *Students who were highly intrinsically motivated to play the exergames, such as having a desire for control and choice and a desire to achieve personal goals, expended more energy during game play than other students did, on average.*

This research, conducted with support from the Health Games Research national program of the Robert Wood Johnson Foundation, suggests that school-based programs that offer active video games to help overweight and obese youth get more physical activity can increase motivation and improve energy expenditure, especially if they involve cooperative teams instead of competitive game play and if they address player's intrinsic motivations. A high attrition rate in this study—resulting, for example, from self-consciousness due to obesity, school truancy or drop-out, school transfer, lack of interest, pregnancy, safety concerns

about walking home in the dark, and schedule conflicts—resulted in only 44 percent of the participants completing the study. – Journal of Diabetes Science and Technology, 7/23/2012

Strategy

"The market for sports and fitness apps will cross $400 million in 2016, according to a new report from ABI Research. The rise of apps for connected wearable fitness devices will be a primary factor in the industry's growth (ABI predicted 80 million such sensors by 2016). ABI predicts that there will be more than 1 billion annual health-related app downloads by the year 2016.

Apps market growth will be strong over the next five years, increasingly rapidly from the $120 million market reported in 2010. Growth will be spurred primarily by sports and fitness applications replacing proprietary devices for viewing data from fitness sensors, with the data collected via the new low-energy Bluetooth 4.0 standard, which has been branded "Bluetooth Smart". Other prominent app categories include home monitoring, personal emergency response services (PERS), and remote monitoring applications." - mobihealthnews.com

This is a not a business plan for a new search engine, a new social network or similar too any app that is currently available. This is a brand new idea that very few are currently seeking to fulfill. There are currently apps on the market that are creating fitness gaming, but they are focused on adults. There are lots of apps directed at children's health, but they are purely information on nutrition and pictures of stretching or exercise.

Projections have shown the VC's and Angel's that the app and eHealth industry is like no other business model as there are innumerable problems that can be solved with gammification processes, and the costs of creating a profitable app company are typically lower. GenZPlay is currently building fitness apps for children. We don't want to stop there. We need to develop sports, nutrition and nature apps as well. Technology is amazing and wonderful but isn't the computer supposed to free our time so we can spend more time with family, friends or enjoying the outdoors.

Here are some practical tips that will help guide us as we are working with the children.

- "Make it fun and interesting. Keeping a child entertained is a challenge, and I'm always working on that secret combination of education and activity."
  —Thomas Nesser, PhD, assistant professor at Indiana State University, Terre Haute
- "Start a program in a facility that already houses kids—schools, churches or temples, recreation or daycare centers, clubs and fitness centers."
  —Karen Wells, director of The First Step, Dunwoody, Georgia
- "Assess the ability level of your client or group and do the right progressions. If you are working with deconditioned overweight kids, any exercise will be hard, so keep it

simple and fun. Don't overwork them—make it a positive experience."
—Benjamin DeLuca, director of fitness at Keystone Athletic Club, Poway, California

- "Let the kids and parents know in advance that they will reach a point, probably around the 3-month mark, where the kids might want to drop out. Get a commitment that they will overcome this hurdle and stick with it, as the kids do get reinvested within a week or two."
—Warren Gendel, founder and CEO of Fitwize 4 Kids, Novato, California
- "Especially with younger kids, you need to make exercise 'play based.' Kids need to learn to move, and they need to move to learn. For example, in order to teach the skills for making healthy food choices, I have the kids play a relay game where they select empty food containers that represent different types of choices. The containers are scattered around the room, and [the kids] have to run and put the containers into boxes marked 'Go,' 'Slow' and 'Whoa.'"
—Cammy Dennis, fitness director of On Top of the World Communities Inc., Ocala, Florida
- "We recommend that parents educate themselves on sound nutrition. Also, start out with small amounts of activity and increase it as time goes by. And be careful about sending negative messages—if we have kids do push-ups or laps as punishment, that will counteract the message that movement is fun and healthy."
—Tom Root, CEO of HOPSports, Valencia, California
- "Incorporate technology, as this is a medium kids relate to. Provide the ability to track results. Kids are smart and catch on quickly, so speak up to them; tell them what they're doing and why, and how it impacts their lives. Kids are familiar with the adage 'Do as I say and not as I do,' so get involved and be a role model."
—Peter Newman, general manager of XaviX, San Diego
- "[Overweight] kids already know they are bigger than other kids and are probably teased, so use a positive and instructive approach. With so many confusing messages out there, be consistent and provide real information and guidance. Watch how you talk about exercise—if you complain, they will too. Avoid comparisons, as there will always be a loser. Appeal to schools and municipalities to increase opportunities, whether it's more recess in school or accessible parks and trails in the community."
—Meredith Griffin, special projects coordinator at the YMCA of the Brandywine Valley in Chester County, Pennsylvania
- "Include the whole family. Not only will everyone lose weight and feel better, but being active as a family strengthens relationships and provides a positive support system. Provide follow-up support as needed, whether by mailings, meetings or message boards."
—Naomi Neufeld, MD, FACE, founder and medical director of KidShape, Los Angeles

Marketing

The approach to bringing these apps to the public will be key as well as our use of capital. With any business, a proper business plan and economic forecasts will help to guide us in our use and pursuit of current and further funding. There will be some initial high capital costs during the R&D stage of 3rd party hardware integration, but the production costs will be quite reasonable as this technology is very easy to design and build. After the initial design and release stages, our marketing costs will

be high as we pursue acceptance among consumers and increase the recognition of our products, but our sales within a short period of time will be able to offset these costs.

Marketing Outlets

1. Website

The website, or any social networking pages, shall be graphically pleasing to children and to adults, user-friendly, and consist of music, sounds and simple games to make the experience enjoyable. A friendly website appearance, feedback from users and fun gaming, health and fitness tips will make our customers feel comfortable while making their purchases. Create a dedicated area on the website just for iOS apps, and allow users to post comments, participate in forums, etc. Provide a video "demo" of the app, in action, which can help users understand the power of the solution

2. Celebrity endorsements

One of the most important concepts of marketing is hype! Celebrity endorsements, whether its a tweet, a few words or a video, can bring substantial visitors to the website or to our products. We currently have a video endorsement by Olympian, Daron Rahlves, and will be creating one with another Olympian, John Emery. We will also be receiving endorsements from movie star, Maria Pitillo, and possibly movie star, Jon Favreau.

3. Sports Race sponsorships

There are many children's functions and adult-sporting functions that are eager to team up with other businesses as sharing promotion increases promotion.

4. Boys & Girls Club (BGC) promotions

Steve Calhoun is currently volunteering a few hours each week to work with the children of the BGC to learn about creating apps. The BGC has a fantastic Intel computer lab, complete with 20 newer iMac's, a sound recording studio, and a video production area. The children are currently creating an informational app, with a donate button, for the BGC supporters and other interested individuals. After the completion of the information app, the children will be working on an interactive app to be sold on the iTunes store to raise funds for the BGC. The BGC is a great source of creative ideas, and mutual promotions. Children can create videos for YouTube of using the app and their suggestions for gameplay and improving.

5. Apps produced for other sporting industries.

GenZPlay recently built an app for the Rahlves Banzai Tour here in California. Over 1000 unique visitors have used this app, and have seen the informational tab for GenZPlay within the app. We are also creating an app for the Bar Effect. The Bar Effect is a gym with 3 locations in the Tahoe area that specializes in training for

professional athletes and look to expand their exposure nationwide via video examples included within their app.

6. Develop relationships with other App developers.

We have found that there are many developers and designers of apps that are either starving for exposure, or are currently at a halt in production. Many of these apps are fantastic ideas without the funding or exposure they need. GenZPlay can capitalize on the apps that have usefulness with the line of apps we are creating. Limited partnerships can be created to have access to their coding or expand the market of the GenZPlay apps.

7. Social marketing campaigns

Social marketing campaigns are one of the most prevalent topics of discussion on Twitter, Quora and LinkedIn forums. There is a unique form of focus that has to be applied to this type of marketing, and GenZPlay has been exposed to the various ideas that are beneficial and the many ideas that have hindered our growth. We intend to use a 3rd party marketing company, Wildfire Apps, to cover these social campaigns, as posting to the various social sites is very time consuming but only requires minimal oversight by GenZPlay.

8. App Review Services

There are many app review services available. Some will review your app for free, buy many require payments between $50-200 to review your app. Lower prices for basic review. Higher prices for a video review. The key is to locate the reviewer's that have the most qualified followers. We will also invite technology bloggers to write about it, including; TUAW, Gizmodo, Engadget, etc.

9. 'Mommy' Bloggers

A new trend of 'Mommy' bloggers has swarmed the Internet in recent years. The findings show that a mother can raise an extra $14,000 a year for the family, by taking a bit of time to write about their care-giving techniques. They review products and apps, give advice and converse openly on their forums. The main source of their revenue is from advertisements placed on their blogging pages. There are currently 4 million 'Mommy' bloggers and they are a great resource for marketing as they are always looking for new content for their blogs, especially any information about children's technology and fitness.

10. Children's fitness & health organizations

There are many organizations such as Michelle Obama's 'Let's Move' campaign and the NFL Play 60 program. These organizations are always interested in posting relevant material to their websites and forums. When it comes to children, competition is not the focus but the health and fitness of the children is what's important. Many organizations are willing to work together.

11. Doctor's offices

The extremely high rates of children's health, obesity and diabetes issues have created a new focus for doctors to spend time with their patients and families on health awareness. GenZPlay has spoken with many doctors who would be willing to promote the GenZPlay apps as a way of giving extra advice and help for families.

12. Press Releases

13. PE Classrooms

GenZPlay and our future products and custom programs will be designed to help the PE teacher continue to make gym an exciting part of the day.

Exergames Unlocked Recommendations for School Implementation:

There are specific challenges to using exergames in schools. In schools exergame users are primarily children, teachers and administrators, who are usually already involved with several initiatives and projects. A typical school day is usually very crammed for a typical teacher, making it difficult to add something additional to their plate. Exergame programs work best when driven by enthusiastic advocates. Here are some simple ideas to help build their confidence and encourage exergame use in school settings:

- Do a short training or demonstrate to school staff how exergames can be used in their setting.
- Share research and helpful resource sites with staff that will help validate the use of exergames in your setting.
- Give guidance on best practices.
- Find interested staff members and delegate “ownership” of equipment.
- Encourage staff members that are utilizing exergames to take equipment home and play during weekends or evenings to familiarize themselves with set up and gaming possibilities.
- Find parent or student volunteers and train them on set-up and use so they can help facilitate game days.
- Encourage teachers to be proactive about game choice with their students, particularly younger audiences.
- Don’t use exergames as a reward, rather, as an opportunity for activity.
- Keep parents informed. Encourage teachers and administrators to educate parents about their exergame program.

-Chamberlin, B., Maloney, A., Gallagher, R. R., & Garza, M. L. (2013). Active video games: Potential for increased activity, suggestions for use, and guidelines for implementation. Serious games for healthcare: Applications and implications (pp. 191–212): IGI Global.

14. Miscellaneous

Copied from a marketing apps application.

So here are 12 potential sources of "blue" -- inbound leads, prospects and referrals. You need to work harder at identifying, specifying, and inquiring about these when GOOD prospects come your way. And even more so when good prospects become clients!

- *Google (or other search engines)*
- *Your articles in hardcopy publications (industry magazines, trade journals, association publications)*
- *Your articles posted online (guest blogs, contributed columns, niche industry websites)*
- *Your social media accounts (Twitter, Linkedin, Facebook, etc.)*
- *Your blog*
- *Your personal network (friends, family, colleagues)*
- *A referral (current client, past client, or non-client fan/influencer)*
- *Directories and listings (online, offline)*
- *Your speaking engagements (local, regional, national, fee or free)*
- *Your videos (on your website or sites like YouTube, Vimeo, etc.)*
- *Your teleseminars (the ones you host or where you're the guest)*
- *Your media interviews (TV, radio, print)*

Conclusion

How will we get them out of the house... make the outdoor systems more enjoyable than being inside. We **CAN** get the children out of the home, away from the gaming consoles, and learning more about nature, nutrition and fitness. A movie by Frontline, called "Growing up online" was on the PBS channel. They interviewed teachers about the interaction with children in the classrooms of today. The biggest finding was that the teachers could no longer just teach, but they had to entertain in order to get the kids attention. We have to make the world that surrounds them more entertaining then the virtual world built into our desktop computers and television sets. Exercise, treasure hunt, educational, and nature games can entertain and be a valuable learning tool. Imagine an interactive story with many possible outcomes that takes place in your own backyard, or park, using the trees, plants and structures within.

> "Overnight, a team transformed the stairs leading out of the Odenplan subway in Stockholm, Sweden, into a giant functioning piano keyboard - much like the piano made famous in the Tom Hanks movie Big. Applying pressure on each step played a musical note. Commuters soon opted for the intriguing new stairway and enjoyed making musical movements as they ascended up and down the scale. The car company found 66% more people than normal chose the musical stairs over the escalator." - by Claire Bates, Oct. 2009
>
> "Kids spend more time watching TV than they do in class (1,500 hours of TV per year vs. 900 hours in school)..... The iPad is interactive, for the most part, rather than passive. Instead of just staring motionless at TV, kids could be solving puzzles, actively playing games, typing, drawing and other activities." --- Is the iPad a healthy *replacement* for TV?, by Mike Elgan, May 7, 2011.

GenZPlay was founded in August 2011 by Stephen Calhoun to make video games a physically active part of his son's outdoor life. The company is focused on integrating gaming mechanics with everyday activities, especially those that need a mixture of fun and adventure to motivate and inspire.
